The outer curve of a meander experiences a greater water velocity which allows more weathering and erosion to occur (destructive forces). Explain the forces happening on the inside curves of meanders. The inside curves on a meander cause the water velocity to decrease and therefore sediments are deposited (constructive force).

Weathering, Erosion, or Deposition Sorting Activity

Erosion is the movement of the particles by ice, wind, or water. The particles are then transported by that agent until they are deposited to form sedimentary deposits, which can be later eroded again or transformed into sedimentary rocks. The weathering of the sediment grains continues during erosion and transportation.
